Modified ordering of the HCP-MMP atlas

The atlas used to define brain regions was the HCP-MMP surface-based atlas (Glasser et al., 2016), illustrated in Fig. S1. In the HCP-MMP atlas, each region has its RegionID, which we show in Table S1. Detailed information about the regions is available in the Supplementary Material File NIHMS68870-supplement-Neuroanatomical_Supplementary_Results.pdf provided by Glasser et al (2016). In that Supplementary Material file, a grouping of the regions is suggested based on geographic proximity and functional similarities, and this grouping is shown in the column labelled CortexID in Table S1. That has led to a different ordering of the regions, which we show in Table S1, with the original regionIDs from the HCP atlas shown in the column headed ‘regionID’. This reordered version of the HCP-MMP atlas is described by Dr Dianne Patterson of the University of Arizona at <https://neuroimaging-core-docs.readthedocs.io/en/latest/pages/atlas.html>, where the following supporting files used to help generate Table S1 are available: HCP-MMP_UniqueRegionList.csv and Glasser_2016_Table.xlsx. We made file HCPMMP_CortexID_Ordering.xlsx from this, and this is available from the present authors. The connectivity matrices shown in the present paper used the ordering shown in Table S1, which is also used in the volumetric and extended form of this atlas (Huang, Rolls, Feng, & Lin, 2022). An introduction to the regions in the HCP-MMP atlas is provided by Rolls (2026).

Table S1. Regions defined in the modified Human Connectome Project atlas (Glasser et al., 2016). L=left hemisphere, R=right. The column ‘Reordered region ID’ is that used in Figs. 1-5, and is a reordering of that based on suggestions in the Supplementary Information of Glasser et al (2016). In that Supplementary Information of that paper, the 360 regions are grouped based on geographic proximity and functional similarities, which was reorganized and provided by Dr Dianne Patterson of the University of Arizona at <https://neuroimaging-core-docs.readthedocs.io/en/latest/pages/atlas.html> with the HCP-MMP UniqueRegionList.csv and is shown in the column labelled CortexID in Table S1. The volumes are in mm³. This modified atlas with the reordering is described elsewhere (Huang et al., 2022).

Reordered ID (L, R)	Region	RegionLongName	Cortical Division	Cortex ID	Original ID	Voxel numbers (1mm ³) (L,R)

Column 1 (Reordered ID) shows the order in HCPex based on the HCP-MMPI_UniqueRegionList.csv, as described in the Methods, of the 360 cortical regions originally defined by Glasser et al (2016). The names of the cortical divisions shown in column 4 come from the same .csv file. The sixth column shows the original order used by Glasser et al (2016). Abbreviations: L=left hemisphere, R=right. MT+_Complex, MT+_Complex_and_Neighboring_Visual_Areas; SomaSens_Motor, Somatosensory_and_Motor; ParaCentral_MidCing, Paracentral_Lobular_and_Mid_Cingulate; Insula_FrontalOperc, Insular_and_Frontal_Opercular; TPO, Temporo-Parieto-Occipital_Junction; AntCing_MedPFC, Anterior_Cingulate_and_Medial_Prefrontal; OrbPolaFrontal, Orbital_and_Polar_Frontal.

Fig. S1-1. Example coronal slices showing regions defined in the HCPex atlas and added subcortical regions (Huang et al., 2022). The abbreviations are as in Table S1. The y values for the coronal slices are in MNI coordinates.

Fig. S1-2. Example coronal slices showing regions defined in the HCPex atlas and added subcortical regions (Huang et al., 2022). The abbreviations are as in Table S1. The y values for the coronal slices are in MNI coordinates.

Fig. S1-3. Example coronal slices showing regions defined in the HCPex atlas and added subcortical regions (Huang et al., 2022). The abbreviations are as in Table S1. The y values for the coronal slices are in MNI coordinates.

Fig. S1-4. Example coronal slices showing regions defined in the HCPex atlas and added subcortical regions (Huang et al., 2022). The abbreviations are as in Table S1. The y values for the coronal slices are in MNI coordinates.

Fig. S1-6. Regions in the Human Connectome Project Multimodal Parcellation atlas (HCP-MMP) (Glasser et al., 2016) and its extended version HCPex (Huang et al., 2022) to show the cortical regions. The regions are shown on images of the human brain with the sulci expanded sufficiently to allow the regions within the sulci to be shown. Abbreviations are provided in Table S1. For comparison, a version of this diagram without the sulci expanded is provided in Fig. S1-5. (HCPBrainMaster4bLC.eps)

The neocortex-hippocampus-neocortex model

The architecture of the neocortex-hippocampus-neocortex integrate-and-fire model of the recall of the whole neocortical what-where memory referred to in Section 10.2 of the paper is shown in Fig. S2. Details of the operation of the model are provided elsewhere (Rolls, Zhang, & Feng, 2024).

Fig. S2. Simulation of neocortical 'what' and 'where' inputs to the hippocampus for the storage of episodic memory, and for the recall of 'what' (object or face) and 'where' (spatial view) information back to the 'what' and 'where' neocortex. The pyramidal cell bodies are shown as triangles, the dendrites as the thick lines above the cell bodies, and the axons as thin lines terminated with an arrow. The numbers of synapses shown are the numbers on any one neuron. The backprojection pathways for memory recall are shown in dashed green lines, and in red the CA3

recurrent collaterals via which ‘what’ and ‘where’ representations present at the same time can be associated during episodic memory storage, and via which completion of a whole memory from a part can occur during recall. All synapses are associatively modifiable except for the Dentate Gyrus (DG) mossy fibre (mf) synapses on the CA3 pyramidal cells. The dentate granule cells, the CA1 cells, and the entorhinal cortex inputs from the neocortex operate as competitive networks. The CA3 cells operate as an autoassociation attractor network to implement completion. The backprojection connections shown in green operate as pattern association networks for hippocampal system to neocortex memory recall (Rolls & Treves, 2024; Rolls, 2026). At the top, the central image shows what might be stored; the right image shows the recall cue, and the network then recalls in the Where neocortex where that face was in the scene shown on the left. This is what the network performs, and is typical of episodic memory in which the locations of faces or objects in a scene are remembered, in mental scene construction. (From Rolls et al (2024)) (NChippArch24Images3.eps)
